

COMMERCIAL REAL ESTATE

How is your cellular service affecting your tenant experience?

Tenants rate communication as the top priority in a workspace. Communication that works everywhere. On every device. It's more important than a gym, a café, or onsite dry cleaning. Communication is key to attracting and retaining quality tenants, and investment in communications increases the value of your property.

The SOLiD Distributed Antenna Solution (DAS) for in-building mobile coverage works. Day in and day out. It fills signal gaps in any type of building, old or new, including LEED buildings. It overcomes interference to deliver a clean, fast, reliable signal. A SOLiD solution is 5G-ready, powerful, modular, and scalable to provide the coverage and connectivity you need.

Healthcare

How is your cellular service affecting your patient care experience?

As a healthcare provider, your goal is to deliver a first-rate patient care experience. Every aspect of that experience is crucial – from ensuring patient privacy and the best possible health outcomes, to complete satisfaction with the staff and facility. And in today's hyperconnected world, the lack of in-building mobile connectivity can significantly impact that experience for patients and their families. Moreover, physicians and staff will BYOD and must have secure and reliable 24x7 mobile connectivity to access electronic healthcare records and application data, which is critical for patient care.

A medical campus or hospital is rarely built with signal delivery in mind, presenting physical challenges to connectivity. SOLiD engineers consider the attributes of each building and create a solution that works. SOLiD in-building mobile coverage provides a pervasive, secure connectivity experience for patients, staff, and families.

Higher Education

How is your cellular service affecting your education experience?

Students, faculty, and staff on college and university campuses expect seamless mobile connectivity. Students want reliable service in the dorm, the classroom, and when moving around campus. Faculty and staff need coverage to provide essential services. Ubiquitous connectivity is key to productivity, security, and peace of mind.

Yet creating a seamless experience is challenging. Campus buildings vary in age, architecture, and building materials, all of which can interfere with cellular signals. Wi-Fi slows down with traffic surges during large events and does not provide seamless mobile coverage. User experience can suffer, causing frustration and a poor impression of the campus.

SOLiD's in-building mobile solutions solve the most difficult campus connectivity issues. 5G-ready, scalable and modular, SOLiD solutions provide consistent coverage during the largest on-campus events, with plenty of bandwidth available for students, faculty, and staff.

HOSPITALITY

How is your cellular service affecting your guest experience?

Premier customer experience is essential for success in the competitive hospitality space, and seamless mobile connectivity is an important key to satisfaction. Shoppers, hotel guests, and event attendees all need to connect at the same time.

This is good news if connectivity is fast and reliable. But all too often, a large influx of users demands more than the available bandwidth and service degrades. With the immediacy of social media sharing, a poor connectivity experience can easily damage your reputation, ...and your profits.

You made a significant investment in your omni-channel visitor experience. Protect that investment with always-on, on-demand mobile connectivity. Whether it's a quiet leisure weekend or a fully-booked week of business events, SOLiD's in-building mobile coverage creates an always-on experience that builds loyalty and keeps customers happy.
